ABSTRACT

Marcy Open School has developed an educational reality where students are given freedom to be creative within a structured curriculum. Reflective of this philosophy are the three priority goals developed by Marcy staff and parents which are: (1) We want girls and boys to speak, listen, write, read, and deal with mathematical concepts effectively and confidently and in order for them to gain proficiency and enjoyment, these skills should be practiced widely as the child pursues his interests and seeks answers to his problems in school and out; (2) We expect that children will take more responsibility for their own learning in all areas--social, academic, and physical; and (3) We hope that children will increase their understanding of their individual rights and the rights of others. In order to accomplish these objectives, effort has been made to create a facilitative learning environment, which includes specially designed spaces with a variety of materials and activities and exploration of community resources. Adult-child interactions are stressed. Quantitative information on student academic achievement is based on standardized tests and qualitative information on participant evaluation. Although Marcy has succeeded in a fully integrated curriculum, questions have been raised on whether such integration is always desirable. (BJG)

June, 1974

The Experimental Schools Program (ESP), a plan testing comprehensive change in education, was initiated in 1971 with the intent to bridge the gap from research and experimentation to practice.

The experimental schools concept became a reality when Congress appropriated \$12 million for the fiscal year 1971 following President Nixon's message on education reform, March 30, 1970. The program was first sponsored by the United States Office of Education and now is directed by the National Institute of Education (NIE).

The Minneapolis Public School District was one of eight school districts throughout the nation that received \$10,000 planning grants to prepare a proposal for a single comprehensive K-12 project. In May, 1971 three of the eight districts, Minneapolis Public Schools, Berkeley Unified School District of Berkeley, California and Franklin Pierce School District of Tacoma, Washington, were selected as experimental school sites as of 1973.

Southeast Alternatives, the name given to the Minneapolis Public Schools' Experimental School Project, was funded for five years. On June 1, 1971, a 27-month operation grant of \$3,580,877 was made to the school district. A final 33-month contract for \$3,036,722 was approved by the National Institute of Education (NIE) on May 22, 1973.

Major factors in the selectic. of southeast Minneapolis as the site for the Minneapolis program were its commitment to a comprehensive proposal, past record of responsible innovation, and plan for providing parent choice of alternative schools. The 2,200 K-12 students in the project include a racially and economically diverse urban population. Southeast Minneapolis, bounded by factories, flour mills, freeways, multiple dwellings, residential neighborhoods, shopping areas and railroads, also houses the main

campus of the University of Minnesota, Minneapolis. Stately old homes, low income apartments and expensive condominiums are all located in the area. This misture of ages, occupations, interests, and life styles supports a diversity of views about the nature of public education which the five SEA alternative schools of parent choice reflect.

The central theme of Southeast Alternatives is to provide comprehensive change in the educational structure and programs for the better education of children. The change is accomplished by offering choices to students, teachers, and parents in the types of educational programs available, involving students, faculty and parents in educational decision-making processes and decentralizing the administrative structure of the school district to local schools.

At the elementary level four major alternative school programs are offered:

The Contemporary School at Tuttle utilizes the graded, primarily self-contained classroom structure. The basic skills of mathematics and language are developed through an individualized multi-text, multi-media approach. Students flow between their base rooms and a variety of learning centers to participate in learning activities throughout the entire school day.

The Continuous Progress primary at Pratt and the Continuous Progress intermediate at Motley allow each child to advance at his own pace without regard to grade level. Mornings are highly structured with language arts, math and social studies. Afternoons are used for two week interest groups designed and implemented by students, faculty and staff, parents and volunteers.

The Open School at Marcy offers flexible curriculum, scheduling and age grouping, with emphasis on helping children to learn to think, and to learn to make independent judgments.

1

BEST COPY AVAILABLE

The Free School (K-12) has curriculum flexibility allowing the student to pursue areas he or she wishes to develop and experience with emphasis on making the curriculum relevant to present day issues and on enhancing students' skills, knowledge and inner autonomy for acting as free people in an environment of rapid, almost radical change. The Free School is particularly committed to recognize and oppose racist, sexist and class oppression in today's world.

At the secondary level the Free School program option is available as well as the flexible Marshall-University High School array of courses and activities. At Marshall-University High School each student with his parents' consent designs his or her education program within a trimester system of twelve week courses. In addition to single discipline courses there are multidisciplinary courses, independent study opportunities, and a variety of off-campus learning programs in the community.

The transitional program for grades 7-8 at Marshall-University High School has been revised to offer choices to students coming from the elementary options. An ungraded Open Classroom and graded classes are available as well as A.L.E., the Adjusted Learning Environment for students with special needs. Teachers work in teams to offer a flexible program to meet the needs of students in the transitional years.

With an opportunity to receive substantial inservice training as well as to provide an avenue for preservice experiences. An Inservice Committee made up of teachers from the schools receives proposals and acts on them, thus providing a direct role for teachers in the staff development activities. The University of Minnesota and Minneapolis Public Schools jointly operate the Teacher Center which was first initiated with federal SEA funds.

Evaluation of the SEA project is both internal and external. The Level I internal evaluation team provides day-to-day responsive formative evaluation to program decision-makers including parents, administrators, faculty, staff and students.

The Level II Evaluation team is organized by the ARIES Corporation. This external team is known as the Minneapolis Evaluation Team (MET) and is accountable directly to N.I.E. The purpose of external evaluation is to independently collect information of a summative nature about SEA which will be of use to practicing educators who are in the process of designing, implementing or operating programs to improve education

-11-

are all intricately intertwined, and have meaning for the school and for the evaluation of the school: represent many of the same values as those of the school. Participants in the school have placed strong value on; designed to include both process and product which are not only compatible with the school, but which in fact, Like Marcy Open School itself, this evaluation is, in many ways, not traditional. It has been consciously (a) personalized curriculum, (b) the experiential nature of learning, and (c) a holistic nature of learning.

MARCY CPEN SCHOOL:

Personalized Curriculum. Curriculum varies for each child as teaching extends from interests, needs and abilities of each child or group of children. The school personnel seeks to be aware of each child as an individual, and of potential relevant learning activities and materials. Decisions on the curriculum are made by the individual child, the teacher, and the parents.

Experiential Nature of Learning. The school seeks to have the children experience language rather than only to learn reading, to experience comput and relationships rather than only to learn about social studies. Participants in the school believe that experience is the best transmitter of knowledge. Further, the child is expected to interact with his environment - to have an effect upon it - to change it or to recognize ways in which he/she seeks to move toward change.

Holistic Nature of Learning. Major emphasis is placed on the interrelatedness of learning. Organizational structures, activities and materials are considered in terms of their multi-dimensionality of goals. Conscious attention is given to a child's feelings about himself and his world, how those relate to his relationship with others and how those relate to his interest and ability in learning. The staff seeks activities which allow the child to experience the relationships between language, computation and other disciplines, rather than departmentalizing them into separate content areas.

ability for the environment described earlier is knowing how children are responding to that environment. An assessment of those responses is part of this evaluation report. A sample of 20% of the September, 1973, enrollment has been selected from among each age group (5-year-olds, 6-year-olds, etc.), from among children of racial minorities and of the racial majority, and from special education children. The following information is reported whenever it is available for those children:

Fall and spring daily activity records
Monthly or weekly activity records
Records of involvements and products from
interest centers
Math, languaging and affective grids
(Marcy-designed records)
Standardized test scores
Samples of writing
Photographs of art work
Selected statements from end-of-year
reports to parents.

O. FEEDBACK TO DECISION-MAKERS

Generally, three types of reports have emerged from the information collected - reports to individual teachers, reports to staff and Advisory Council, report to the general public.

All information which is collected is given to the teachers involved, in either written or verbal form. Specific details are included, identifying children, activities, and time so that the information can be used in appropriate and meaningful ways for planning.

Two generalized reports have been presented to the Marcy staff and Marcy Advisory Council, one during December, 1973, and a second in May, 1974. These reports contained all information available - written

in summarized form so that specific classrooms and children could not be identified. Specific meetings of the two groups were set aside for discussion of the reports and the implications for program of the information they contained. In addition, the reports were referred to at various times throughput the year as program-planning was in progress.

This report is designed so as to be reproduced in larger quantities and made available to all Marcy parer.ts, to interested Minneapolis Public School personnel and to other interested educators. As described in the introduction to this report, it is designed to allow readers to experience, to interact, and to bring their own values to bear on whatever decisions may be relevant to their own roles.

the responsibility onto themselves for learning. In order for this to be accomplished, children must have choices in what they do - an opportunity to make good choices and to reap the benefits, and an opportunity to make ballity for those choices rests with the child. The teacher's role in this process will vary with the needs of the particular child.

Goal 3: We hope that children will increase their understanding of their individual rights and the rights of others. The goal is to consciously help children to be aware of their own and others' rights and how to maintain them. To this end they are included in the process of decision-making in establishing and maintaining classroom rules and procedures, and when individuals or groups come into conflict, in determining possible solutions and in implementing a favored solution.

B. TIME

Table 1 lists the approximate periods of time which all classrooms in the building spend in daily activities relating to children's experiences in goal areas. The times are approximate, and will vary with special activities. All activities within a category, e.g., all activities done by children during project time, will not necessarily relate to all the goal-areas checked in the table.

One primary teacher has described more fully the kinds of activities which occur in her room during these time periods and how she believes that they expose children to the experiences expressed in the goals:

Circle Meetings - There are generally four group meetings during the day. During the morning meeting the children speak and listen to each other while sharing experiences or special possessions. They have practice in waiting their turn to initiate or respond, to be politely heard, to give and receive

4

-7-

compliments and to plan upcoming activities. Before dispersing for quiet time, the children sign up for special centers and indicate reading writing and math activities they plan to pursue with consent or recommendations from the teacher.

The circle meeting after recess is for discussion of any problems that have occurred in the morning. These frequently involve the abuse of the rights of others and the discussion centers on feelings and alternative acceptable behaviors. Decisions for project time activities are stated, including those in special interest centers. Children are encouraged to follow-through on their plans and to be considerate of the space, equipment and noise-level needs of other activities in the room.

Prior to lunch is a time to evaluate work accomplished and to give consideration and direction for furthering progress. The circle meeting following lunch is primarily for practicing skills in question asking, sumarizing, evaluating, observing and other thinking and process skills.

Quiet Time - The child takes the responsibility for following through with his plan and for seeking help when needed from peers or adults. The child chooses his reading and math material with guidance when he has difficulty selecting what is appropriate for his ability. Games requiring reading and/or math skills are acceptable choices for the child. Multiple choices are available for writing.

Project Time - Choices range from integrated projects (crayfish) and integrated activities (Monopoly) to art projects or games that have less integration of subject matter. Projects may involve a small group or a single individual and cover varying lengths of time. Skill help is given by peers or adults as needed. Quiet time activities may also occur during this time.

During October, 1973, spot observations of activities in two classrooms were conducted during quiet time. Activities and their relationship to Goals 1 and 3 are listed in Table 2. Such observations could not reveal any relationship to Goal 2. Links between activities indicate that children or groups of children were working together or side-by-side. The numbers in parenthesis indicate the number involved in an activity.

the maps indicate the number of children in that area of the room during a May, 1974, spot observation. tables and room dividers. The following maps illustrate two of the classroom arrangements and the materials Classrooms and hallways throughout Marcy are arranged into various large and small areas separated by bookcases, individual rights and rights of others) are not facilitated in any particular area of the room. facilitate: A = languaging, B = math. located in each area of the room. The circled letters indicate a part of Goal 1 which that area is arranged to Goal 2 (taking responsibility for own learning) and Goal 3 (understanding The numbers on

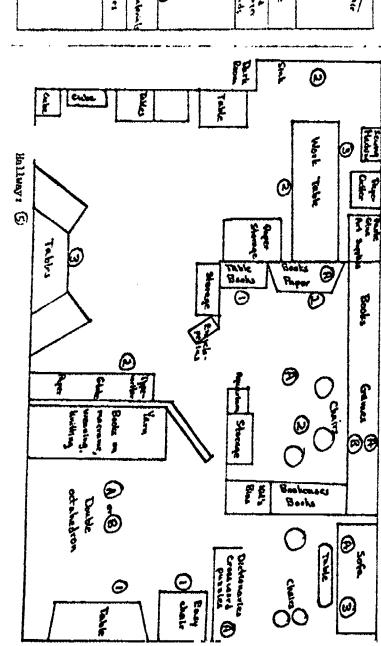

Primary Classroom:

In addition to the classroom itself, space in the hallway is sometimes used by children and adults. An additional small room in the basement is used for some small group activities with five-year-olds.

Intermediate Classroom

16

In the hallway outside of this classroom are three tables, two room dividers, a teacher's desk and file cabinet, and floor space which is often used for activities by teachers and children from the room.

place Other spaces in the building are designed for encouraging growth in goal areas: Hammer Hall (industrial arts), room, gymnasium, pottery room, multi-media and a small-group counseling room. in these spaces will be described in the activities section of this report. The activities which take

D. MATERIALS

Each room contains a variety of materials with which children may work. The primary and intermediate teachers were asked to list the languaging materials in their rooms during the week of April 1, 1974. Responses from the randomly selected primary and intermediate rooms were:

Art materials	Chalk board	Puppetry	Writing materials	Flashcards	Books	Records	Tapes	Playhouse	Sand table	Cames	Books for writing	Moffett Cards
Newspapers	Worksheets	People	Encyclopedias	Typewriter	Mini-pacs	Workbooks	Writing activity cards	Handwriting charts	Conics	Magazines	Dictionaries	Basal readers

A playhouse area is found in every primary classroom and is considered by the staff to be an activity directly relating to languaging. In playhouse, children from a wide variety of backgrounds and experiences play together and communicate with each other. In this setting, words and ideas are imaginatively generated by role playing. Children take on another life-experience, another perspective, and another style of speaking. They must learn to communicate clearly with each other in order to share the experiences in the playhouse.

Teachers were also asked to list the math materials in their rooms during the same week. Responses by the same two teachers as above were:

Workbooks	Clock	Water	Sand	Counters	Flashcards	Balance	Paper	String	Games	Mearsuring instruments	Blocks
Maps	Geo-blocks	SRA cards	Geo-board	Pattern blocks	Attribute blocks	Timer	Humidiguide	Worksheets	Mini-pacs	Activity Cards	Money

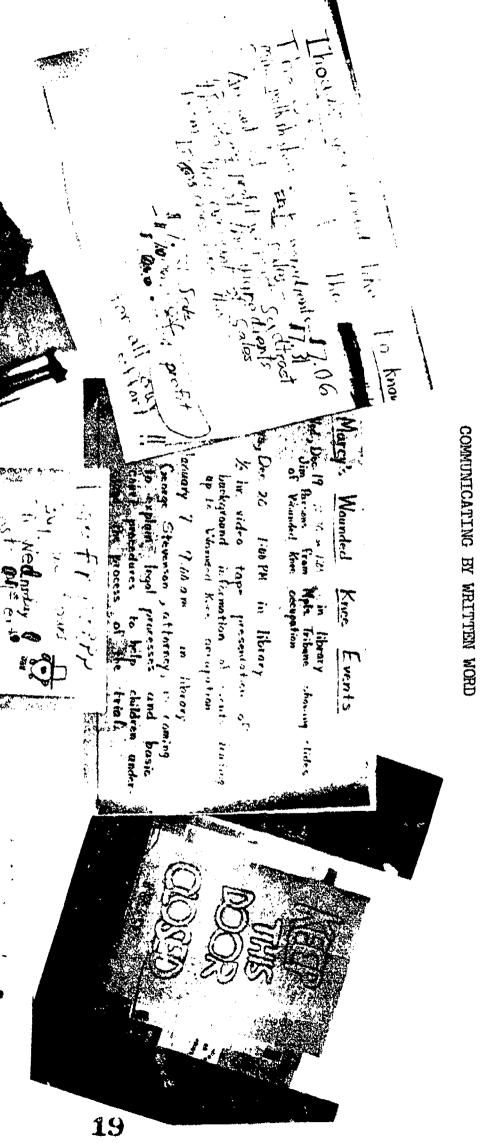

The relationship of some of these materials to mathematical skills is shown in Table 3.

Intermediate Room	Sand Sand Haking piles of sand Sand Sand Haking shapes in sand Sol Building and hills and Gla and building Co.	Materials Activity	Table 3. Relationship of common materials to mathematical skills.
Measurement skills Addition Ratio and proportion of scale drawing. t Rarimam and minimum providence		Comparing Sorting Classifying Hatching Counting	Mathematic Skill	thematical skills.

In addition to the materials in the classrooms at any given time, teachers and children have access to the math and reading bank. Located on the first floor of the building, the bank is maintained by math and reading specialists and contains commercial and volunteer-made books, games and other materials categorized according to skill-level.

-12-

Activities are available for Marcy Children in various settings and situations. For the purposes of this report, six types of activities will be described: 1. Classroom Activities, 2. Interest Centers, 3. Community Volunteer Program, 1. Community Day, 5. Special Education, 6. Counseling.

1. Classroom Activities - Classroom teachers are responsible for structuring activities in their rooms in response to the needs and interests of individual children and of the group. The responses of the sample pirmary and intermediate teachers concerning goal-related activities during one day in April, 1974 are listed below:

(a) languaging activities

Primary - creative dramatics, reading, writing, playhouse, puzzles, alphabet game, records, blocks, cutting pattern pictures, astronomy group, Star Trek.

Intermediate - reading, homonym-synonym worksheets, writing baseball stories, creating games, figuring and writing recipes and plans for camp, writing poems, map reading, discussing and reading about Finland, Probe, Silly Syntax, research on birds and coins, adult reading to group.

(b) math activities

Primary - cutting patterns, work in books, weighing, measuring, estimating, chess. Trouble, home-made games, color math, flashcards.

Intermediate - division, metric sheet, miles on Mexico trip, calculator, comparative pricing, Heads Up, Psychopaths, story problems relating to camping, geometry test, skull squeezers, timing flow of liquids, balancing chemical equations, baseball game.

(c) activities for taking responsibility for learning.

Primary - quiet time, club, space trip, painting, batiking, card-making, games, legoes, blocks.

Intermeidate - expectation that all are actively involved, daily record chart, recordkeeping folders, appropriately setting up centers, value clarification exercise, choosing and carrying through on involvements.

(d) activities for understanding individual rights and rights of others.

Primary - playhouse, games, playground, quiet during skills time, space limitations, small "problem" meetings.

Intermediate - group ratings on students entering reading meeting late, discussion of name-calling, continual awareness of voice-control, talking-through hurt feelings, putting materials away, determining fair way to sign up for gym, listening to others in meetings.

A primary goal of the school is integration of learning experiences. To this end, it is important to note the nature of the activities listed by the teachers in the categories (a) through (d) above. In all of these categories, the experiences include some very skill-oriented tasks as well as tasks which include many processes and subject areas. For example, languaging activities in the intermediate room include homonym-synonym worksheets as well as writing recipes and plans for camp.

The curriculum "tree" on the following page is a further illustration of the integration of curriculum valued at Marcy. The basic theme of the tree is Native Americans. Children in the room participated in any branches of the tree by choice and, in fact designed the branches themselves. The reader might look at this "three" and relate the activities to the three goals being examined in this report.

munity Day - In February, 1974, a pilot Community Day Program was implemented at Marcy. This program represents an intensification of the Community Volunteer Program and of the priority of the school to erase some of the walls between school and community.

The original proposal, written by a committee of staff and parents in the summer of 1973, lists two purposes of Community Day:

(1) to more fully integrate the school curriculum with people, places, and things in the community, and

(2) to provide teachers with a partial school day for planning and staff development.

Tuesday has been designated as Community Day when childeren from a number of classrooms, supervised by volunteers and school staff, make use of the community. Small groups of students meet with their teachers and with the Community Day Developer to identify areas of interest and ongoing study in the classroom.

It is primarily the task of the Community Day Developer to locate sites and resources where children can have an experience related to the identified areas and to set up whatever transportation, volunteers and resources which are necessary. In some classrooms, students were also active in arranging for the experiences.

Though the original proposal called for all classrooms to participate in Community Day every week, the pilot program showed that this was impossible to arrange. Generally three or four classrooms can be accomodated on any given week.

Tables 6 and 7 list the activities in which primary and intermediate children from the randomly selected

primary and intermediate rooms participated during one Community Day in May, 1974:

More detailed information on the integration of Community Day activities into the ongoing activities in classrooms and on the planning and staff development of teachers during the freed time, see the separate evaluation report, "Marcy Open School Community Day Program Report," available from SEA Internal Evaluation.

svailable for children who are diagnosed as having a learning disability, or as being mentally retarded. The two special education teachers work approximately one hour per day with each of 28 children in raived. The children are first identified through teacher referral which includes information on academic, conceptual, perceptual and social characteristics. They are then tested with the Peabody Individual Achievement Test, Jastak Wide Range Achievement Testing, and two tests designed by the special education teachers - Individual Word Analysis Survey and Marcy Math. The recommendations of the special education teachers are then taken to the Pupil Personnel Support team for decision on placement in the program.

Children identified as having a learning disability or as being mentally retarded are "mainstreamed" and spend most of their day participating in the normal activities in a regular classroom.

In addition, for approximately one hour per day, the children meet in groups of one to four children with the special education teachers for special activities in math, reading language development and social skills. By April, 1974, some of the children no longer required special help in math, so they were doing that work in their regular classrooms, sometimes utilizing additional materials provided by the special education teachers.

In the spring, all participating children are re-tested and informally observed, and the information gathered is referred back to the Pupil Personnel Support team to determine whether they will remain in the program the following fall.

designed to service not only children, but also parents and school staff. To this end, the counselor's main efforts have been directed toward implementing a developmental approach, introducing guidance-based curricula into the classroom, teaching counseling and guidance skills to staff and refining the role of the Pupil Personnel Team. The Pupil Personnel Team consists of specialists, including the counselor, social worker, psychologist, principal, nurse, special education and any other appropriate classroom teacher, working together as a team in order to provide maximum support and aid to teachers, students and parents.

The counselor also maintains guidance groups of eight to ten students and facilitates small group counseling. Guidance groups are formed from a random selection of children and participate in activities designed to facilitate growth in social skills.

Counseling groups evolve around some difficulty of a particular child or group of children. These might include poor self-image, poor attitude toward school, poor social interaction skills, etc. Groups are formed to include children who are doing well in those areas to serve as models. The groups meet in approximately two sessions per week and include interaction activities that will correlate with the specific objective of the group.

Groups continue until interest of the children wanes or until indications of growth are visible.

In keeping with the s other concepts. bal/nonverbal communication, child development, and time will be allocated during the 1974-1975 school interactions between adults and children. Direct A wealth of information is waiting to be

Implementation of a children's interview with approximately 20% of the student population has, however, provided an indirect picture of at least one aspect of the adult-child interactions - communication of teacher expectations of appropriateness of activities. A portion of the interview involved asking children about what they can do during the various parts of their school day, through the following kinds of questions:

What kinds of things happen during the first meeting of the day?

What can you do after that meeting? What else could you do if you wanted to? What else could you do? etc., etc.

What kinds of things can you do for reading? What else?.....

What kinds of things can you do for math?.....

The attempt was to prove as far as possible what all the child saw as options during the day.

The same questions were also asked of the teachers to reveal their perceptions of the day. In addition, information as to what the children actually did throughout the day was available from classroom observations conducted three to four weeks earlier. Thus, a three-fold picture can be drawn from each classroom:

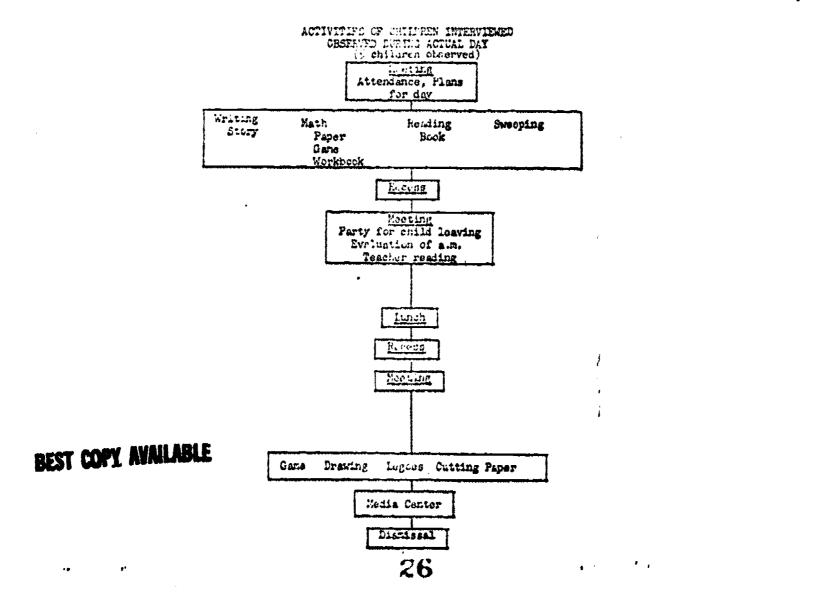

- 1. The teacher's perception of the day,
- The children's verbal perceptions of the day, and
- The same children's actual behavior during a day.

The information from all ten classrooms in Marcy is available in a separate report, "Children's Perceptions of Choice and Contribution to the Environment - Marcy Open School", available from SEA Internal Evaluation. Information from the random sample of two classrooms is included in this report.

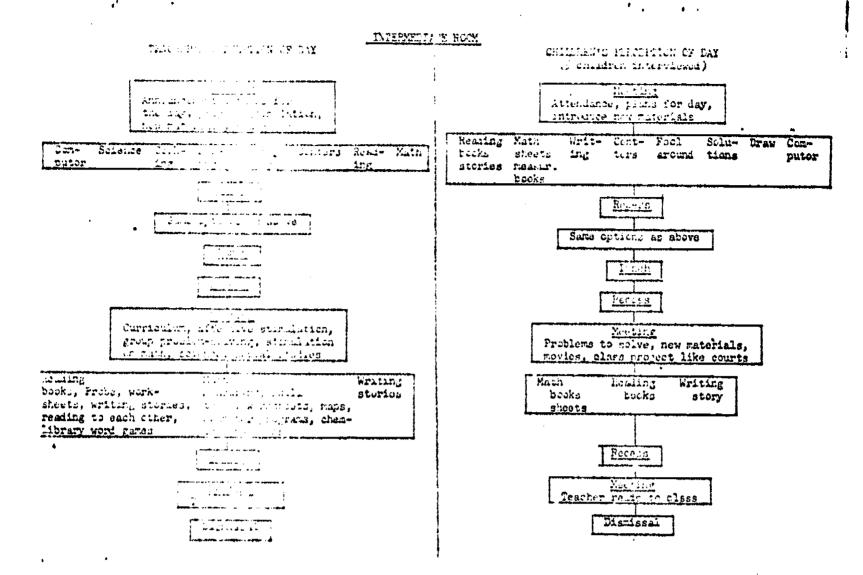

25

In examining the following two charts, the reader might bear in mind the following:

- l. Level of consistency between children's verbal perceptions and actual behavior,
- consistency between children's perceptions and the teacher's perceptions, both in terms of categories and in terms of the variety of activities under those categories, and
- 3. Variation of degree of structure in classrooms.

The second secon

The second half of the interview relates to Goal 2 - children taking responsibility for their own learning. The purpose was not to determine whether children do take responsibility, but to determine whether children perceive that the environment of the school is such that it is possible for them to take responsibility.

To this end, the questions were aimed at determining how the child perceives:

- his/her own contribution to the classroom environment,
- 2. the concribution of the teacher to the classroom environment,
- 3. the contribution of peers to the classroom environment.

Some of the questions in this section of the children's interview were developed by Nancy Miller, Center for Teaching and Learning, University of North Dakota, January, 1973.

Other questions which seemed relevant to the Marcy program were written, pretested, and included in the interview.

Children's responses for each of the three categories of questions were coded as follows:

- 1 = firm negative contribution to environment
- 2 = uncertain contribution to environment
- 3 = firm positive contribution to environment

The average for the ten Marcy classrooms are listed in Table 8:

Table 8. Children's perceptions of the contribution of the child, the teacher, and of peers to the classroom environment.

Sections B and C present detailed information on all six and ten year olds in the sample, including: information which is available on these children. This report attempts to summarize the volu... of

Goal-relatedness of activities during one day in October, and one day in April. The criactivity. Relatedness to Goal 3 is indicated adult or whether the child chose to do the basis of their content. working together and thus having to adjust if the activity involves two or more people working without direct supervision of an activity to Gaol 2 is whether the child is terion used to determine relatedness of an Meetings are related to Goals 2 and 3 on the to each other's needs, wants and rights.

Participation in Hammer Hall, gym, music, and media are reported as that information is available. No records are available for pottery. It should be stressed that these interest-center records relate only to involvement of children during "option" time, and do not include activities when a entire classroom may participate as a unit. At best, these records are sketchy, but they do provide some sense of involvement.

Classroom records are maintained by many of the teachers, either on a monthly or a weekly basis.

A semple of such records is included when available. Special programs basically includes three categories.

Special programs basically includes three categories of experiences - special education, counseling, and an intermediate tutoring program staffed by trained volunteers.

Languaging and math grids are Marcy designed records which are completed for each child two or three times each year. Samples of the grids can be found in the Appendix. The number of skills mastered or used frequently in each of the grid categories is graphed - both for school year 172-173 and school year 173-174. The number in parenthesis and the divisions on the bar indicate the number of skills in each category. Hence, the shaded portion of the bar indicates the proportion of skills mastered.

The affective grid is also a Marcy designed record. It is a highly subjective instrument so that it is impossible to make comparisons across different raters. Thus, the graphs contain comparisons for the ratings in November and in April. Teachers did not have access to the November, 1973 grids at the time that they completed the April, 1974 grids.

Standardized test scores are included for those tests taken by the child since enrollment in Marcy Open School.

Excerpts from end-of-the-year report. to parents are included as available. Most of these reports include input from both the child, the teacher, and other adults who work regularly in the room.

A small number of photographs of art work and writing complete the sections on six and ten year olds.

Section D contains quantitative summaries of the same information for all age-groups.

Since the age-level groupings refer to age during the 73/74 school year the 72/73 graphs for children one year older are actually for students the same age. Thus, comparisons between graphs on this basis provides some indication of the consistency of skills mastery across school years.

or practice. This is not to suggest that none of the children in a classroom understand the possibilinot be denied, however, that at least some of the activities-particularly under the categories of readsometimes report a much wider range of possible possibility nor did they actually behave in that way. children are not understanding that the range of the children are included in the interviews. It canties which are open to them, as only about 20% of ing, writing, and math-than children either report The larger inconsistency emerges as the teachers

a. The teacher does desire the wider range of activities, but needs to find ways of better communicating and reinforcing this expectation to all children.

I suggest two possible reasons:

There are several possible reasons for the discrepency.

activities are possible which the teacher reports.

- b. The teacher makes one kind of public statement of expectation, but in fact is unconfortable with practicing those expectations.
 The reasons for the discomfort need to be
 examined so that she/he can be open about
 honest expectations.
- that different degrees of structure are implemented in the various classrooms in the school. These variations are in terms of the breadth of acceptable activities during various parts of the day and in the kinds of activities which are made available for children in various rooms. The school's emphasis on personalization of curriculum and acceptance of various teaching and learning styles would indicate that these variations are healthy.

The second half of the interview also shows some interesting things about children's perceptions - this time in how they see the contributions which various people make toward the classroom environment. Table 8, page 22, shows a fairly consistent direction of

- b. Integration is an ideal toward which the school is aiming, but traditional training of teachers and traditional expectations of parents make this a long-term process. Thus, the program may need to look at ways of moving away from the current subject-orientation and the public statements should be changed to reflect the on-going growth in this direction rather than stating integration as being an accomplished fact.
- c. The information which emerges from the interview and observations is inconclusive and should be examined and expanded.

Again, the issue is not one of whether activities speak to a multiplicity of goals. As stated earlier, the data clearly shows that they do. The issue is, however, that children's responses to interview questions suggest that, in their minds, basic skills are separate subjects.

between children's verbalizations, as revealed in the interview, and their actual behavior, as revealed in the observations. That is, if they said that they could do reading, writing and math and that those involved books and papers, those tended to be the activities which they, in fact did do. If they said that thrucks, sand, do art projects, play games, go to centers, and a wide variety of activities, those wide variety of things tended to be, in fact, what they did do. It is important to reiterate that approximately three to four weeks elapsed between the observations and the interviews. Thus, this consistency appears to hold over time.

There are some inconsistencies between the teacher's and the children's perceptions. In some cases the teacher indicates that it is appropriate to go to interest centers during a particular time period. The children interviewed did not verbalize that as a

positive contribution moving from child to teacher to peers, with a smaller gap between contribution of the child and the contribution of the teacher than between contribution of the teacher and the contribution of peers. This is certainly in line with public statements by the school which voice a commitment to children and teachers both contributing and determining the academic and social setting of the school. However, the low contribution of peers may be worthy of further consideration.

- B. Comments on Children's Data:
- l. Six Year-Olds Generally, activities of all children relate to all the goals. The bar graphs on the languaging grids show that at most a child gained two skills and at worst a child lost mastery of four skills over the one year period. Fairly consistent growth is evident on math grids as is a movement from left to right on the affective grids.
- It is interesting to look at the profiles on particular children. The six year-old girl described on page 27 raises possible questions. There is no evidence of participation in interest centers during option time, but she has participated in many activities in the classroom. She has a relatively high standardized test score, but has mastered the fewest skills of all the six year-olds in the sample on the languaging grids.

The six year-old boy described on page 29 shows some growth in languaging and relatively great growth in rath and affective. The affective growth may be related to his participation in small-group counseling.

2. Ten Year-Olds - Overall, these profiles show very little mastery in division and multiplication on the math grids (an average of 15 skills is mastered). Is that a comfortable level for children of that age?

Unfortunately most languaging grids for these children were not available from the "72-"73 school year, so levels of growth cannot be seen. Most have, however, mastered all precoding and decoding skills by the end of school year "73-174. Activities of all of these children also relate to all the goals being studied.

3. Total Summary - Table 10, page 41 does not reveal any clear-cut lines with regard to participation of children in interest centers. The range is from 0% (five year-olds in music) to 100% (nine year-olds with books from the library). Five year-olds tended to participate less, but this is not always true. Harmer Hall ranged 33% (six year-olds) to 70% (eight year-olds) to 90% (five year-olds) to 90% (ll year-olds) to 60% (seven year-olds) to 60% (seven year-olds) to 100% (nine year-olds)

Information not included in this report shows that participation spreads evenly in all centers for both boys and girls.

It is unfortunate that languaging grids are not available for '72-'73 for ten and eleven year-olds. The bar graphs show that in almost all age levels and for all skill categories, mastery is not as high in April '74 as for children one year older in May '73. A lack of growth is apparent for seven and eight year-olds.

All precoding and decoding skills are mastered by age eleven. Frequency of affective observations are relatively high for six and seven year-olds and drop to lower levels for older children.

127-

The math grids show a consistent growth for all ages in all skills, with the exception of eight year-olds in addition and subtraction. A leap of growth is evident for 11 year-olds. Mastery is higher for age categories at the end of '73-'74 than for children one year older at the end of '72-'73. The exception is eight year-olds who are behind where nine year-olds are last year. There appears to be inconsistency in mastery of multiplication and division skills across the various ages.

Affective bar graphs show a growth from left to right for all ages, except eight and nine year-olds who moved in the opposite direction.

the growth of skill mastery and the recording of that growth on the grids. It is not known whether the growth or lack of growth which is summarized here is, in fact, known by the classroom teacher. To what extent do the teachers have ready ways of comparing grid masteries over the two year period? Assuming that it is a child's growth, rather than his/her achievement of some set standard for his age level, that is important, then it is important that the teacher, the child, and the parent be able to see that growth.

Clearly, growth is visible in ways other than grid recordings. Informal observations of activities by parents and teachers and a sense of accomplishment by the child himself or herself are most important indicators. If the grids are useful, however, then is that information easy to see from year to year?

A question might also be raised about the grids themselves. Are the recordings of mastery accurate? Are the grids sufficiently objective to be able to draw conclusions from year to year as the teacher making the recordings changes? If not, then of what value are the grids?

A look at the recordkeeping grids also relates to the questions of integration. Goal 1 states "We want girls and boys to speak, listen, write, read and deal with mathematical concepts effectively and confidently." The wording of the goal places value on kids knowing languaging skills and being able to use them. The languaging grid reflects both of these. The first two sections of the grid list reading skills: precoding and decoding. The second two sections list uses of communication skills and areas of confidence and enjoyment in the use of languaging processes.

concepts". math purposely uses the phrase, "deal with mathematical sere way as does the languaging grid. I believe there defined skills. Thus, the math grid does not reflect not, however, reflected in the math recordkeeping grid. Through a series of seven categories of various and flow of the world in contrast to a narrow intershould be a serious consideration of the implications confidently," is reduced to his mastery of specificallyskill:. This broad interpretation of mathematics is The second half of Goal 1 which speaks to the area of of this discrepancy. the values represented in the goal statement in the "dealing with mathematical concepts effectively and types of calculation skills, a child's progress in pretation of math as beinga series of calculation That phrase means the patterns, symmetry,

5. Suggestions for Action

The previous pages raise the following issues which I believe to deserve staff and parent consideration:

--Integrated curriculum.

What is it?

Does Marcy have it?

Does Marcy want it?

What public statements does the school make about it?

--Contribution to environment.

Do the children's interview responses

Do the children's interview responses (Table 8) reveal a comfortable distribution?

Does the distribution suggest any need for change?

-- Recordkeeping grids.

Are they sufficiently objective to make comparisons?

Is the math grid sufficient to reflect the math grid?

Do te chers currently see grids from previous years?

Is it important that they do so?

--Skill growth and activities.

Are school participants comfortable with the growth reflected on various record-keeping grids?

Are they comfortable with the range of activities in which children are participating?

-- Interest centers.

Do the records reveal a comfortable level of child-rarticipation?

Are the records sufficiently extensive to make such a judgment?

In addition, I would strongly urge that readers examine the report for areas of interest which I have not identified here.

D. Final Comments

A school is a culture. Marcy Open School is a culture. To reflect the school in any written document is an impossible task. This evaluation does, however, attempt to reflect what the school does for children. As a growing, evolving institution, it is hopeful that the school can be aware of its strengths and weaknesses in a more self-conscious way and, therefore, change in ways which may be more appropriate to the goals

of the participants. It is hoped that this document can provide information that will serve as a link in that process.

-61-

In May, 1974, the Marcy Advisory Council and staff received a preliminary copy of the infomation in this document. A panel of parents and staff reacted to it and a general discussion followed. The report has now been referred to the Evaluation Committee (a standing committee of the Advisory Council) for more detailed consideration of program implications.

For the process of this document the evaluator sought a written response from Marcy. Time prohibited putting together a collective response so, in conference with the principal, Glen Enos, a procedure was decided upon.

The following people were given a draft of this iccument and were asked to write their comments and reactions: Jack Arnold, teacher aide

Launa Ellison, intermediate teacher Peggy Hunter, primary teacher Jay Scoggins, primary teacher Jim Smith, parent

Timi Stevens, parent

Bill Stockton, a parent and chairperson of the Evaluation Committee, then summarized those reactions. It is expected that further consideration will be given to the information in the document throughout the next school year.

Bill's compilation and summary follows:

The reactions of Marcy folks to this report ranged from a Socratic dialogue, in which the "puzzling premise" of accountability and the "elusive concept" of "integration" were cooly considered - to an angry, principled inattention to the contents. In the presence of such diversity one doesn't summarize but gives thanks that only six were consulted. The following comments attempt to describe the variety of reactions.

Perhaps the only generalization warranted is that the four staff members and two parents focused on the introductory and summary remarks of the evaluator. Little was said directly about the data presented.

Staff members seemed most concerned about the evaluator's comments concerning the question of "integration" of reading writing and math into the curriculum. Two agreed that the integration was an ideal toward which they wished to struggle. Another suggested another interpretation of the special treatment of these skills in the school. "I believe integration of contents is crucial in motivating and practicing. I, just as strongly, believe the understanding of the mechanics of a skill needs separately defined time. A child intensely involved in a project cannot cope with the slowness of figuring through a new skill. Likewise s/he cannot focus on both the skill understanding and it's purpose — it's meaning in the project, at the same moment." The staff who commented on the issue seemed to agree that the integrated curriculum is very much a part of their concern and ought not be abandoned.

A parent, in the context of a dialogue, seems to agree:

- A: Come on; the subjects are still identifiable. There is still deliberate instruction in subject skills, like arithmetic.
- Z: Yes, and when that happens, 'integration' is not as thorough-going as we might have been left to think.
- A: Are you suggesting that deliberate instruction in skills cannot be integrated?
- Z: Right. At least in the same way that the items, say in the languaging grid can be integrated.

-65-

But then, perhaps it shouldn't be.
